- ✓ Multiple Anti-Virus Vendors Supported
- ✓ Blocks/Disarms Dangerous Content in E-Mails
- ✓ Multiple Large Black Lists
- ✓ Individual User Accounts and Logins
- ✓ Bi-Directional Scanning on all Filters

Anti-Spam Filter with Grey Listing Technology

Anti-Virus Filter with Multiple Vendors Supported

The Anti-Spam Filter with Grey Listing is a unique technology to eliminate spam before it enters the network. For the highest security there are as default multiple Anti Virus vendors scanning the email traffic for viruses.

Anti-Spam Filter with Grey Listing Technology

The Protector comes with the unique Anti-Spam Grey Listing technology. The first time it receives an email, it blocks the sender for 10 minutes. Most systems that are sending spam are compromised Windows computers that just send the spam mails one time or retry within 5 minutes when real mail servers continue to resend the mails.

When a valid mail server is resending the mail, the Grey Listing will then whitelist it and trust the sender. In this way, 75-85% of all spam is blocked before even entering the network.

The remaining 15-25% spam that comes into the network is then scanned by the state of the art anti spam engine.

Full POP3 and SMTP Support

The Protector has full POP3 and SMTP support for scanning mails on both protocols.

So even though the customer is running the POP3 Protocol, all their mails are still scanned for spam, viruses and dangerous content.

Outlook like POP3 Webmail

Manage all your POP3 mails via a Outlook-like and feel secure webmail interface.

Phishing Protection

The Anti-Phishing feature protects user from all sorts of phishing mails. Attackers use phishing mail to trick users to go to a fake site that looks like the legitimate site of, for example, a bank. By this the user can be tricked to giving up sensitive information such as bank credentials.

Blocks Image Spam, PDF Spam, Stock Spam.

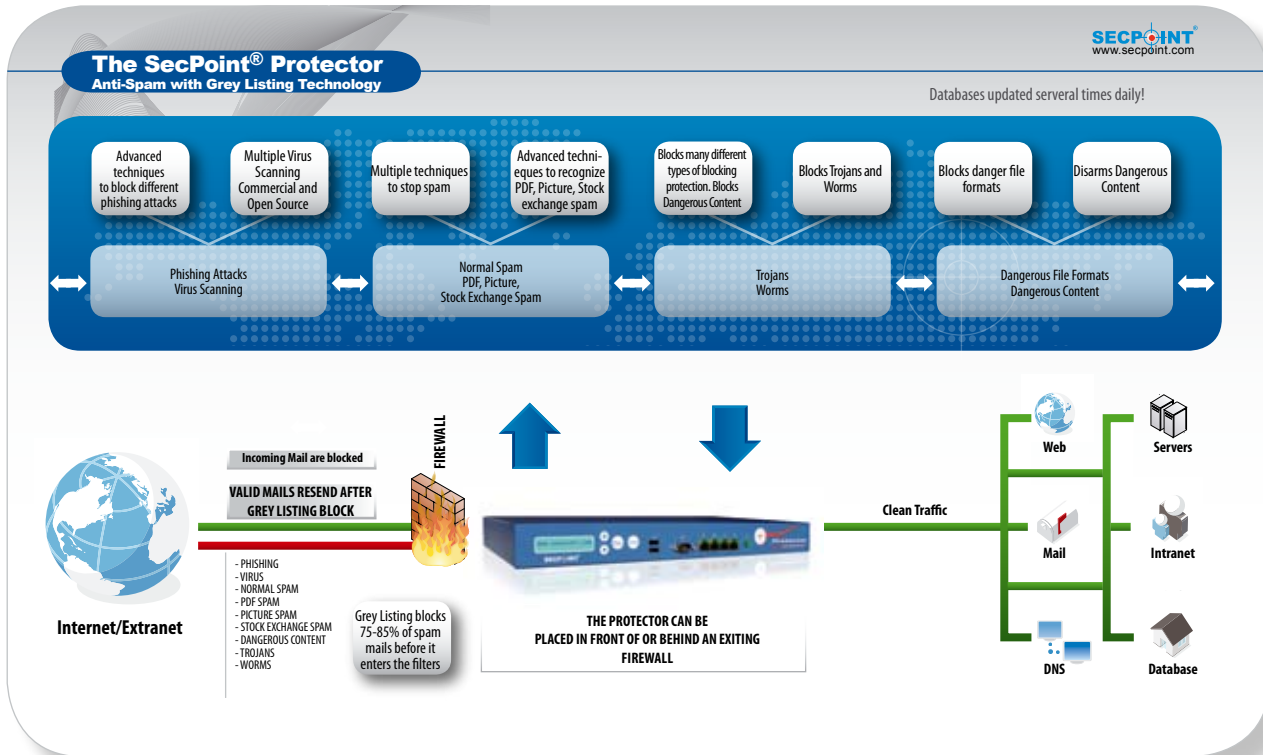

Protector Anti-Spam identifies and blocks Image, PDF Spam, and Stock spam mails even though they are made to trick spam filters with unclear text in them.

Multiple Anti-Virus Vendors Supported

This includes BitDefender, Kaspersky, Norman and open source ClamAV.

Blocks/Disarms Dangerous Content in E-Mails

The Protector blocks or disarms dangerous content such as Form Tags, IFrame Tags, Object Codebase Tags, Script Tags and WebBugs. These can be exploited if they carry dangerous code in them. Individual User Accounts and Logins. All users can login individually and maintain their own spam quarantine account. Furthermore, they can set their own individually chosen spam level and manage their own white/blacklist.
